These handmade thin Danish pattern soaps (brick) vary slightly in color. Open all of the crates and use from them at random so the color variations will be well mixed. This makes a good antique look.

Handmade brick vary in size also. These are about 4 1/4" x 8 1/2" or 9". Always make the space of one brick including the end and side joint 4 3/4" x 9" or 9 1/2" letting the joint be larger or smaller as necessary.

To install the brick, we recommend a mortar mix of one part gray Portland cement and four parts fine sand wetted with half water and half Acryl 60 (or Acrylbond). This makes a strong waterproof bond. Wet the back of the brick and the slab a little if necessary. Clean mortar from the top of the brick with a wet sponge as you go. **Don't let it dry on the surface of the brick.**

Before grouting the joints, seal the installed brick surface by rolling on a coat of clear silicone sealer (we recommend Water Ban 90) or at least some Thompsons' Water Seal. This can be done a short time before grouting, (half hour), will give the best look, and save a great deal of time and labor.

Make the grout from one part white cement, four parts fine sifted sand, a small amount of yellow cement coloring, (about one ounce for a five gallon bucket of mix), and some water. Don't make it too thin. Put the thick grout mixture into the joints with the edge of your trowel, packing it in and leveling as you go. Follow up in a short time with rodding tool. We use one made from a 1/2" PVC pipe. Clean any smears from the brick with a damp sponge.

If you follow these instructions you will be very pleased with the results. Call us if you have any questions. We will be glad to help.

PLEASE DO NOT ACID WASH OR PRESSURE WASH THESE COLORED CONCRETE PRODUCTS.
